

Vapour Blasting

Vapour blasting is an ideal process to clean non-ferrous cast alloy parts for restoration, or in preparation for weld repair or non-destructive testing. It introduces no dimensional change nor does it heat or warp the part. It leaves a semi gloss; closed-surface finish that makes the part appear like it did in its original as-cast condition.

The process is superior to any dry blasting process for restoring alloy parts including bead, soda and dry-ice blasting since all of these processes leave an inferior open-surface which is susceptible to finger print and carbon/oil stains and are more likely to introduce dimensional changes to the part essentially damaging the part and reducing its value.

We work on a wide array of motorcycle, ATV, snowmobile, aviation and similar applications.

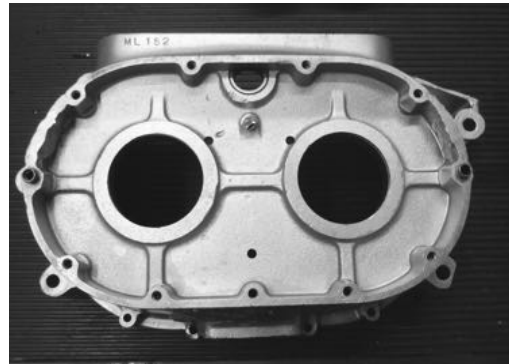

In addition to Vapour Blasting, Rocket Performance is your source for water jet cutting. We also sell great products like ACF-50 and a complete line of Evans Waterless Engine Coolants.
